# Traversing the Maze, Plan C: Triple Ultrasonic Sensor

Friday, 6 March 2020 12:35 PM

I found this arduino solution with three Ultrasonic sensors: <u>https://maker.pro/arduino/tutorial/how-to-build-an-arduino-based-maze-solving-robot</u>

#### **Build Idea**

I will use this build as a starting point: <u>https://www.filcasts.com/materials/354-freedom-folk-race-tank-robot-with-treads-and-three-ultrasonic-sensors</u>

I have decoded the arduino code from source 1 into the following algorithm:

Loop Forever // get readings distFront = front ultrasonic distance distLeft = left ultrasonic distance distRight = right ultrasonic distance

//clear in front, move forward
if distFront > 20
 forward 1 sec

// if wall is between 10 and 20 on the left, move forward if distLeft > 10 and distLeft < 20 forward 1 sec //if move away from the wall on the left, steer gradually back if distLeft >= 20 spin left a bit 30ms forward 1 sec // if too close to wall on left, drive right a bit if distLeft < 10 and distLeft > 0 spin right a bit 30ms forward 1 sec //wall in front but clear to the right if distFront <= 10 and distRight > 20 stop 300ms spin right 90 degrees //both front and right have a wall spin right 180 degrees if distFront <= 20 and distRight < 20 stop 1 sec spin right 180 degrees

#### test 2

- forward and stop at wall in front
- stick to left hand wall
- turn left if clear

Sec	urstreit		urti asonite		istance
set	distRigh	t 🔹 to	ultrasonic	1 🔻	distance
if	dist	ront 🔻	> • 7	then	
tar	nk motors	B+C 🔻	-25 % -2	5 % 🕀	
$\odot$					

This works OK, but is a bit jerky. A PID control would be good

test 3 -

- forward and stop at wall in front
- stick to left hand wall
- turn left if clear
- wall in front but clear to the right

	●

Test 4 -

- forward and stop at wall in front
   stick to left hand wall
- turn left if clear
- wall in front but clear to the right
- dead end both front and right have a wall spin right 180 degrees

lego-TripleB uild (11)

EVALUATE & REFINE

All went well when there were dead ends to the left, as this is a left hand rule algorithm. However, dead-ends were skipped when running the maze the other way and dead-ends were on the right. This actually would not be a problem if the maze is closed and the entry and exit is the same.

Dead-ends to the right

Dead-ends to the left

For mazes where the entry and exit are in different places, the solution would be to have a left or right program loaded up and make sure that you are traversing the maze in the correct direction.

Of all the plans, so far, this one has been the most effective.

#### Source 2

Here is another idea. I haven't coded or tested this out. Give it a go!

https://www.youtube.com/watch?v=AJkUfTUXxEE&feature=youtu.be

### 1st refinement

Set dis to 25 Loop forever Check left, front, right distances If wall on all 3 sides, dead end Turn right until 180 degrees the other way If wall on right and front sides Turn left If wall on left and front sides Turn right If wall on front side Turn right If wall on left side Turn right Go forward If wall on right side

Go forward

Turn left Go forward

Else

## 2nd Refinement

# dis = 25

Loop forever Check left, front, right distances

If frontSensor < dis AND rightSensor < dis AND leftSensor < dis spin right 180 degrees	// wall in front of all 3 sides, dead end
Else if frontSensor < dis AND rightSensor < dis AND leftSensor > dis spin left 90 degrees	// wall on right and front sides
Else if frontSensor < dis AND rightSensor > dis AND leftSensor < dis spin right 90 degrees	// wall on left and front sides
Else if frontSensor < dis AND rightSensor > dis AND leftSensor > dis spin right 90 degrees	// wall on front side
Else if frontSensor > dis AND rightSensor > dis AND leftSensor < dis spin right 180 ms forward	// wall on left side; follow wall and correct
Else if frontSensor > dis AND rightSensor < dis AND leftSensor > dis spin left 180 ms forward	//wall on right side; steer away

#### Else

forward

#### 3rd refinement
